

PMG Global has distribution rights to a Munich Germany based Wireless Software Solutions Company called Aventeon (www.Aventeon.com). This company develops software solutions that run on Palm Devices and Pocket PCs. Aventeon is the market leader in developing and realizing mobile data solutions for truck drivers and is an expert in the automation of mobile business processes. Aventeon's wireless solutions also help the field sales and service staff of large organizations to connect seamlessly to any database in the enterprise. They can send and receive data all through the day. The sales and service staff of the enterprise DO NOT have to be in a network area to send and receive data. Aventeon's proprietary MBA client (Mobile Business Assistant) Client and MBA Server technology automatically syncs up the devices every time they enter a network area. This allows for uninterrupted working leading to a highly productive mobile force. PMG Global and Aventeon offer an exciting range of wireless solutions for customers in the Utilities and Logistics sectors.

The following link gives more information about the wireless solutions available for the Utilities and Logistics sectors:

Logistics companies today face unprecedented challenges. The business is no longer about carrying goods from A to B: it goes beyond simple logistics and warehouse management to value-added services for effective supply chain management. Outsourcing deals have taken logistics to the next level, forming long-term partnerships between logistic companies and their customers. Aventeon Logistics.ONE™ has been designed for the unique workflow of mobile logistics, delivering industryspecific benefits that help improve performance and customer responsiveness.

Even when tasks are carefully defined, the transport and logistics process requires (on average) 2 or more days to complete*. Key tasks like re-assignment and issue management (problems on the road: delays, truck malfunctioning or at the customer location: missing goods, damaged goods, location not found) are triggered by results obtained at the end of the tour. The absence of real time data on how the process runs at the customer location diminishes internal efficiency and customer responsiveness.

Logistics.ONE™ optimizes the logistics process by enabling key tasks to be performed in real time, via synchronization of target data. Customer responsiveness and internal efficiency are enhanced. The whole process is completed in 1 day, gaining valuable insight on every step of the tour.

Logistics.ONE™ supports the entire logistics process by providing the following benefits:

- Advanced dispatching functionalities — real time status of all scheduled deliveries
- Essential data at point-of-need – location, order and item level
- Clever synchronization of delivery status, costs, activities, time & kilometers data
- Real-time track & tracing for customers and central planning function
- Mobile process integration across the entire Supply Chain (Warehouse – Transport – P/D Location)
